Hilbert's Program

- Formalize mathematics in a common framework;
- Establish Axioms to prove all mathematical truth;

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Prove that the system is consistent.

Hilbert's Program

- Formalize mathematics in a common framework;
- Establish Axioms to prove all mathematical truth;
- Prove that the system is consistent.

Gödel's Answer

For any strong enough and consistent axiom system, there is always a true sentence which is unprovable. Such sentence can be written as a statement about natural numbers.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Hilbert's Program

- Formalize mathematics in a common framework;
- Establish Axioms to prove all mathematical truth;
- Prove that the system is consistent.

Gödel's Answer

- For any strong enough and consistent axiom system, there is always a true sentence which is unprovable. Such sentence can be written as a statement about natural numbers.
- In fact, no consistent axiom system can prove its own consistency, i.e., the statement that the system is consistent.

A combinatorial result:

Notation

We use $[X]^k$ to denote the collection of all *k*-element subsets of *X*, and $N = \{0, 1, 2..., N - 1\}$.

Ramsey's Theorem

For every k, m, there is a number N such that for any $f : [N]^k \to \{0, 1\}$, there is a subset $X \subset N$ of size at least m such that $f \upharpoonright [X]^k$ is constant.

A finite set of natural numbers is large if its size is greater than or equal to its least element.

Modified Ramsey's Theorem

For every k, m, there is a number N such that for any $f : [N]^k \to \{0, 1\}$, there is a large subset $X \subset N$ of size at least m such that $f \upharpoonright [X]^k$ is constant.

A finite set of natural numbers is large if its size is greater than or equal to its least element.

Modified Ramsey's Theorem

For every k, m, there is a number N such that for any $f : [N]^k \to \{0, 1\}$, there is a large subset $X \subset N$ of size at least m such that $f \upharpoonright [X]^k$ is constant.

Paris-Harrington Theorem

The Modified Ramsey's Theorem is not provable in Peano Arithmetic (PA, basic axioms about natural numbers plus induction).

Quantifier Complexity

Given a sentence P in arithmetic $(\mathbb{N}, +, \times)$, we define the quantifier complexity by the number of alternations of quantifiers $(\forall \text{ and } \exists)$ in P.

Examples:

- Goldbach Conjecture (Π₁)
- Odd Perfect Number Conjecture (Π₁)
- Twin Prime Conjecture (Π₂)
- "3x + 1" Conjecture (Π₂)
- " $P \neq NP$ " (Π_2)
- Riemann Hypothesis (equivalent to Π₁)
- $\pi + e$ is rational (Σ_2)
- abc Conjecture (Π₃)

Quantifier Complexity

Given a sentence P in arithmetic $(\mathbb{N}, +, \times)$, we define the quantifier complexity by the number of alternations of quantifiers $(\forall \text{ and } \exists)$ in P.

Examples:

- Goldbach Conjecture (Π₁)
- Odd Perfect Number Conjecture (Π₁)
- Twin Prime Conjecture (Π₂)
- "3x + 1" Conjecture (Π₂)
- " $P \neq NP$ " (Π_2)
- Riemann Hypothesis (equivalent to Π₁)
- $\pi + e$ is rational (Σ_2)
- abc Conjecture (Π₃)
- "X is provable/unprovable in PA" (Σ₁/Π₁)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Facts

• "*P* is unprovable" is a Π_1 sentence.

Given an unprovable sentence P, how hard it might be to prove the sentence "P is unprovable (say in PA)" (the unprovability of P)?

Facts

- "*P* is unprovable" is a Π_1 sentence.
- ► This sentence proves the con(PA), the consistency of PA.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Given an unprovable sentence P, how hard it might be to prove the sentence "P is unprovable (say in PA)" (the unprovability of P)?

Facts

- "*P* is unprovable" is a Π_1 sentence.
- ► This sentence proves the con(PA), the consistency of PA.
- For the Gödel's self-reference sentence, or the Modified Ramsey Theorem, we only need con(PA) to prove that it is unprovable.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Given an unprovable sentence P, how hard it might be to prove the sentence "P is unprovable (say in PA)" (the unprovability of P)?

Facts

- "*P* is unprovable" is a Π_1 sentence.
- ► This sentence proves the con(PA), the consistency of PA.
- For the Gödel's self-reference sentence, or the Modified Ramsey Theorem, we only need con(PA) to prove that it is unprovable.
- So is Con(PA) always enough to prove such unprovability statement?

For every true Π_1 sentence Q which proves the con(PA), there is a true sentence P such that PA proves:

 $Q \Leftrightarrow$ "*P* is unprovable in PA".

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

For every true Π_1 sentence Q which proves the con(PA), there is a true sentence P such that PA proves:

 $Q \Leftrightarrow$ "*P* is unprovable in PA".

Corollary

A sentence Q is provably equivalent to the unprovability of some sentence if and only if Q is provably equivalent to a Π_1 sentence which proves the con(PA).

For every true Π_1 sentence Q which proves the con(PA), there is a true sentence P such that PA proves:

 $Q \Leftrightarrow$ "*P* is unprovable in PA".

Corollary

A sentence Q is provably equivalent to the unprovability of some sentence if and only if Q is provably equivalent to a Π_1 sentence which proves the con(PA). So the unprovability of a sentence could be arbitrarily hard to prove.

Proof, very sketchy Requirements: $Prov(P) \iff \neg Q$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Requirements: $Prov(P) \iff \neg Q$.

We use a dynamic (effective) method to construct a sentence P assuming that we already know its Gödel number, with the following properties:

Requirements: $Prov(P) \iff \neg Q$.

We use a dynamic (effective) method to construct a sentence P assuming that we already know its Gödel number, with the following properties:

If we detect that ¬Q is true in the construction (we find a witness which falsifies Q), then we make P provably true, for example make P equivalent to 0 = 0.

Requirements: $Prov(P) \iff \neg Q$.

We use a dynamic (effective) method to construct a sentence P assuming that we already know its Gödel number, with the following properties:

- If we detect that ¬Q is true in the construction (we find a witness which falsifies Q), then we make P provably true, for example make P equivalent to 0 = 0.
- If we detect that Prov(P) is true, i.e., we find a proof from PA to P,

Requirements: $Prov(P) \iff \neg Q$.

We use a dynamic (effective) method to construct a sentence P assuming that we already know its Gödel number, with the following properties:

- If we detect that ¬Q is true in the construction (we find a witness which falsifies Q), then we make P provably true, for example make P equivalent to 0 = 0.
- If we detect that Prov(P) is true, i.e., we find a proof from PA to P, then we make P provably equivalent to Con(PA). (So if this happens, then PA proves Con(PA), and by Gödel, this implies ¬Con(PA), which implies ¬Q).

Given any consistent theory T extending the base theory PA, we can always find a true sentence P such that:

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

- ► T does not prove P, and
- ► T does not prove "P is unprovable in PA".

We may have to accept some open conjectures (e.g., Riemann Hypothesis) and use them as axioms if we fail to prove them and fail to prove that they are unprovable.

・ロト・日本・モート モー うへぐ

- We may have to accept some open conjectures (e.g., Riemann Hypothesis) and use them as axioms if we fail to prove them and fail to prove that they are unprovable.
- Natural candidates of such new "axioms" are Π₁ sentences (typically, consistency of a system such as ZFC).

- We may have to accept some open conjectures (e.g., Riemann Hypothesis) and use them as axioms if we fail to prove them and fail to prove that they are unprovable.
- Natural candidates of such new "axioms" are Π₁ sentences (typically, consistency of a system such as ZFC).
- Given an open conjecture P, if it is unprovable, it is still possible we can prove P from such a new "axiom", e.g., a true Π₁ sentence.

- We may have to accept some open conjectures (e.g., Riemann Hypothesis) and use them as axioms if we fail to prove them and fail to prove that they are unprovable.
- Natural candidates of such new "axioms" are Π₁ sentences (typically, consistency of a system such as ZFC).
- Given an open conjecture P, if it is unprovable, it is still possible we can prove P from such a new "axiom", e.g., a true Π₁ sentence.
- So how about proving everything from true Π₁ sentences?

- We may have to accept some open conjectures (e.g., Riemann Hypothesis) and use them as axioms if we fail to prove them and fail to prove that they are unprovable.
- Natural candidates of such new "axioms" are Π₁ sentences (typically, consistency of a system such as ZFC).
- Given an open conjecture P, if it is unprovable, it is still possible we can prove P from such a new "axiom", e.g., a true Π₁ sentence.
- So how about proving everything from true Π₁ sentences?

The story continues...

The Modified Ramsey Theorem (which is Π_2) is not provable in PA from any true Π_1 sentence.

Given a sentence P, we define the level-2 unprovability (resp. level-n) of P as the following sentence:

"*P* is not provable in PA from any true Π_1 (resp. Π_{n-1}) sentence"

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Given a sentence P, we define the level-2 unprovability (resp. level-n) of P as the following sentence:

"*P* is not provable in PA from any true Π_1 (resp. Π_{n-1}) sentence"

Theorem [C.]

The level-*n* unprovability of a sentence could be arbitrarily hard to prove. More precisely, A sentence *Q* is provably equivalent to a level-*n* unprovability of some sentence if and only if it is provably equivalent to a Π_n sentence which proves the Π_n -soundness of PA.

Given a sentence P, we define the level-2 unprovability (resp. level-n) of P as the following sentence:

"*P* is not provable in PA from any true Π_1 (resp. Π_{n-1}) sentence"

Theorem [C.]

The level-*n* unprovability of a sentence could be arbitrarily hard to prove. More precisely, A sentence Q is provably equivalent to a level-*n* unprovability of some sentence if and only if it is provably equivalent to a Π_n sentence which proves the Π_n -soundness of PA.

Proof, very very sketchy

Relativize the previous proof above $\mathbf{0}^{(n-1)}$.
